

BODY RECOMPOSITION BLUEPRINT

THE MOG EFFECT

Body Recomposition & Fat Loss
for Busy Dads & High-Performing Men

WHAT YOU'LL MASTER INSIDE

- + 12-Week Body Recomp Framework
- + 3-Day Resistance Training Split
- + Protein-First Nutrition System
- + Travel & Work Dinner Protocols
- + Weekend Control System
- + Plateau-Breaking Diagnostics

What's Inside

- 01 Introduction — Why Most Plans Fail Busy Men
- 02 The Mog Effect — 5 Core Principles
- 03 The Busy Man Problem (Diagnosed)
- 04 Body Recomposition Framework
- 05 Nutrition Rules That Actually Work
- 06 Sample Day of Eating + Plate Formula
- 07 The 3-Day Training Split (Full Program)
- 08 Cardio Without Burning Out
- 09 Travel, Work Dinners & Family Life
- 10 The Weekend Control System
- 11 Recovery, Sleep & Stress
- 12 How to Track Progress (5 Metrics)
- 13 The 12-Week Mog Effect Plan
- 14 The 9 Mistakes That Kill Results
- 15 Your Next Step — The Coaching Path

This blueprint is built for action — not for collecting. Each section has a clear protocol you can execute this week.

Why Most Plans Fail Busy Men

Most busy men don't need a more extreme plan. They need a plan that survives real life. The Mog Effect is engineered for the man balancing work, fatherhood, travel, client dinners, and performance — who still wants to look strong, feel sharp, and lead from the front.

This blueprint is for busy dads, sales professionals, executives, and high-performing men who want body recomposition: losing fat while building or preserving muscle. Research consistently points to resistance training, higher protein intake, calorie control, and sustainable habits as the core drivers of body recomposition — not suffering.

The point is not to live like a bodybuilder. The point is to create a body that reflects the same standard you already hold in business, leadership, and family.

3x Workouts / Week	12 Weeks to Results	1g/lb Daily Protein Target	10K Steps / Day Goal
------------------------------	-------------------------------	--------------------------------------	--------------------------------

Who This Is Built For

- + Dads who can't spend 2 hours in the gym
- + Sales reps on the road 3+ days a week
- + Executives eating out 4+ nights a week
- + Anyone who restarts 'Monday' every single week
- + Men 30–55 who want to look and feel 10 years younger

> The Standard

The Mog Effect is a standard, not a plan. Plans expire. A standard stays with you on the road, at family dinners, and during brutal quarters. That's what separates men who look the part from men who keep meaning to get there.

The 5 Core Principles

The Mog Effect is built on five non-negotiables. Everything in this blueprint traces back to one of these. If you follow them consistently, the result is inevitable.

01 Simplicity Beats Intensity

A plan you can repeat at 80% beats a perfect plan you abandon. Complexity is the enemy of compliance. Every protocol in this blueprint is designed to survive a bad week.

02 Protein and Lifting Drive the Look

You don't need cardio-only plans. You need muscle under the fat. Lifting tells your body what to keep. Protein gives it the materials. Everything else is secondary.

03 Time Efficiency Over Gym Volume

Three focused sessions beat six mediocre ones. The man with an hour and a clear plan outperforms the man with three hours and no direction. Every session in this split has a specific purpose.

04 Travel and Fatherhood Are Built In

If the plan breaks the moment you board a plane or your kid gets sick, it's not your plan — it's someone else's plan borrowed temporarily. This one accounts for your actual life.

05 Consistency Is the Real Flex

The guy with the best body in the room isn't the one who trained hardest last week. He's the one who didn't miss for 90 days straight. Consistency compounds.

“Most men stay stuck because they treat fitness like a side hobby instead of a system. A system wins when motivation disappears.”

The Busy Man Problem — Diagnosed

Most busy men aren't failing because they're lazy. They're failing because the plan they tried was built for someone with fewer demands, lower stress, and more available time. The problem isn't willpower — it's architecture.

The 7 Patterns That Keep Men Stuck

- ✗ Skipping meals all day, then overeating at night (saving calories that don't exist)
- ✗ Training hard for 2 days, then disappearing for 5 — breaking adaptation cycles
- ✗ Being disciplined Monday through Thursday, reckless Friday through Sunday
- ✗ Using travel, client dinners, or kids' schedules as weekly reset triggers
- ✗ Confusing exhaustion with productive training — sweat != progress
- ✗ Starting new plans every Monday instead of fixing the one that broke
- ✗ Treating nutrition as all-or-nothing — one bad meal becomes a bad week

>> The Fix Isn't More Discipline

Body recomposition works best when training, protein intake, and calorie control are STEADY over time — not aggressive in short bursts. You don't need more willpower. You need a system that doesn't require it.

What The Research Actually Says

Studies on body recomposition consistently show that the largest predictors of fat loss success are adherence, protein intake, and consistent resistance training — not the specific diet type, training split, or supplement stack you're using. The fancy details matter far less than showing up.

This blueprint is designed around maximizing adherence, not maximizing theoretical perfection. A B+ plan executed every week beats an A+ plan executed when life cooperates.

The Body Recomposition Framework

Body recomposition — losing fat while maintaining or gaining muscle — requires four levers working together. Pull just one and you stall. Pull all four consistently and you transform. Here's the framework every protocol in this blueprint is built around.

LEVER 1

Resistance Training

3× per week. Progressive overload. You're telling your body what muscle to keep while in a calorie deficit. Skip this and you lose muscle with the fat — shrinking but not improving.

LEVER 2

Protein Intake

0.8–1g per pound of bodyweight daily. This is the single most supported nutrition variable in the research. It protects muscle, reduces hunger, and raises your metabolic floor.

LEVER 3

Calorie Control

A modest deficit of 300–500 calories below maintenance. Not a starvation diet. Aggressive cuts destroy muscle and crash testosterone. Slow and steady wins for body recomposition.

LEVER 4

Sleep & Recovery

7+ hours minimum. This is where recomposition actually happens. Testosterone is released during deep sleep. Poor sleep spikes cortisol, increases hunger, and destroys gym performance.

The Mental Model

LIFT WEIGHTS	Tell your body what muscle to keep
--------------	------------------------------------

EAT ENOUGH PROTEIN	Recover, rebuild, and stay full
CONTROL CALORIES	Create the deficit that burns fat
WALK DAILY	Increase output without raising stress
SLEEP 7+ HOURS	Where recomposition actually occurs

Nutrition Rules That Actually Work

Nutrition for busy men needs to be simple enough to repeat under pressure — at the airport, at a client dinner, and at your kids' soccer game. The most effective nutrition plan is the one you can actually follow.

The Mog Effect Meal Structure

- + Eat 3–4 meals per day (no grazing, no random snacking)
- + Target 30–50g of protein per meal — anchor every plate around it
- + Keep weekday meals repetitive — decision fatigue kills adherence
- + Save flexibility for evenings, family events, and social occasions
- + Front-load protein — get 50%+ of your daily total before 2pm

The Plate Formula

PROTEIN FIRST	Chicken, steak, fish, eggs, Greek yogurt, whey protein — aim for 35–50g per meal
SMART CARBS	White rice, potatoes, oats, fruit, wraps — carbs fuel performance and recovery
FIBER	Vegetables, salad, berries — fill your plate, slow digestion, hit micronutrients
HEALTHY FATS	Avocado, olive oil, nuts, whole eggs — keep hormones healthy, especially testosterone

Non-Negotiable Rules

- + Never let a meal be random if it could be planned 10 minutes ahead
- + Protein first at every restaurant — scan the menu for protein, build from there
- + Don't drink your calories (juice, soda, blended drinks, alcohol adds up fast)
- + Keep hyper-palatable junk out of the house during the week — environment wins
- + Never starve all day to 'save calories' for one big dinner — it always backfires
- + Alcohol is optional, not forbidden — 2 drinks max on fat-loss weeks

Sample Day of Eating

Here's a realistic, repeatable day for a busy executive or dad. This structure clocks in around 2,400–2,800 calories with 200–230g of protein — enough to drive recomposition without feeling like a diet.

MEAL	WHAT TO EAT	PROTEIN
Breakfast 7–8am	3 whole eggs + 3 egg whites scrambled, ½ cup oats with berries, black coffee	~40g
Lunch 12–1pm	8oz grilled chicken or steak, 1 cup white rice, large salad with olive oil dressing	~55g
Snack / Pre Workout	Whey protein shake (35g protein) + banana or rice cakes	~37g
Dinner 7–8pm	6oz salmon or 8oz lean ground beef, roasted potatoes or sweet potato, vegetables	48g
Optional 9–10pm	¾ cup Greek yogurt + handful of berries (if still hungry)	~18g
DAILY TOTAL (approximate)		~198–228g

What Makes This Work

Every meal anchors around protein. Breakfast isn't eggs and oatmeal — it's 40g of protein with oatmeal on the side. That mental shift changes the entire structure of your day. When protein comes first, calories regulate themselves naturally.

TRAVEL VERSION: Chipotle double chicken bowl, any hotel breakfast with eggs, Chick-fil-A grilled chicken sandwich. You can hit your protein target in any city in America without meal prep.

The 3-Day Training Split

Busy men don't need six gym days. They need a training split they can hit every single week. Three focused, progressive sessions is enough to drive significant recomposition for most men. Here is the complete program.

DAY 1 — UPPER BODY

EXERCISE	SETS	REPS	NOTES
Incline Dumbbell Press	3	6–10	Control the descent
Pull-Up or Lat Pulldown	3	8–12	Full range of motion
Seated Shoulder Press	3	8–10	No arching the back
Chest-Supported Row	3	8–12	Squeeze at the top
Lateral Raise	3	12–20	Light weight, slow
Bicep/Tricep Superset	2–3	10–15	Minimal rest

DAY 2 — LOWER BODY

EXERCISE	SETS	REPS	NOTES
Squat (Barbell or Goblet)	3	5–8	Depth matters
Romanian Deadlift	3	6–10	Hip hinge, not back
Leg Press or Split Squat	3	8–12	Unilateral preferred
Hamstring Curl	3	10–15	Slow eccentric
Calf Raises	3	12–20	Full stretch
Core or Weighted Carry	2–3	—	Farmer carries, planks

DAY 3 — FULL BODY STRENGTH

EXERCISE	SETS	REPS	NOTES
Trap-Bar / Conventional Deadlift	3	4–6	Heaviest session
Dumbbell Bench Press	3	8–10	Keep shoulder blades back
One-Arm Dumbbell Row	3	8–12	Full stretch at bottom
Walking Lunges	2–3	10ea leg	Bodyweight or loaded

Rear Delt or Lateral Raise	3	12-20	Shoulder health
8-12 Min Conditioning	1	—	Bike, rower, or sled

**Progressive overload rule: add weight, reps, or a set before you add a new exercise.
Complexity is the enemy of progress.**

Cardio Without Burning Out

Most busy men overestimate how much cardio they need and underestimate how much walking they need. Extreme cardio is not the optimal long-term answer for body recomposition. Lifting, calorie control, and sustainable activity matter more.

The Mog Effect Cardio Stack

DAILY STEPS	8,000–10,000 steps The single most underrated fat-loss tool available to busy men
LOW-INTENSITY	2×/week, 15–25 min Walking, incline treadmill, bike — keeps cortisol low
OPTIONAL HIIT	1×/week, 10–15 min Only if recovery is solid and you're not feeling beat up
POST-MEAL WALKS	10 min after meals Improves insulin sensitivity, adds easy steps, clears your head

>> Cardio is support — not punishment

The purpose of cardio is to help recovery, increase calorie output, and improve consistency. It should not create fatigue that compromises your lifting or make you ravenously hungry. If cardio is making you eat more, cut the sessions and add steps instead.

The Easiest Win

Walk for 10 minutes after lunch and 10 minutes after dinner. That's it. Two walks a day adds 1,500–2,000 extra steps, improves blood sugar regulation, and creates a low-cortisol calorie burn you can sustain forever. No gym required. No schedule needed.

Travel, Work Dinners & Family Life

If the plan only works when life is calm, it is not a real plan. The Mog Effect expects travel, client dinners, kids' schedules, and last-minute changes. Here's how to win in all of them.

Travel Protocol

- + Get protein in early — hotel breakfast before a flight beats skipping it
- + Train for 30–40 minutes instead of skipping entirely (shortened is not failed)
- + Walk in airports — skip the moving walkways, take stairs, pace during calls
- + Cap alcohol to 2 drinks on travel nights (dehydration and poor sleep compound quickly)
- + Go back to normal immediately after the trip — no 'recovery week'

Hotel Gym Fallback Workout (30 min)

EXERCISE	SETS × REPS
Goblet Squat (dumbbell)	4 × 10
Dumbbell Romanian Deadlift	4 × 10
Dumbbell Bench Press	4 × 8–12
One-Arm Dumbbell Row	4 × 10
Lateral + Rear Delt Raise	3 × 15
Incline Treadmill Walk	10 minutes

Client Dinners & Social Events

- + Scan the menu for protein first — steak, chicken, fish, shrimp are always available
- + Eat a protein snack before arriving if you're starving — don't arrive ravenous
- + Skip the bread basket — nobody remembers it anyway
- + Sparkling water between drinks slows alcohol consumption naturally
- + Don't make your food choices anyone else's topic — order confidently and move on

The Weekend Control System

Most men are disciplined during the week and erase their progress Friday evening through Sunday. Three days of recklessness can offset five days of discipline. The answer is not cutting out every social event — it's controlling the five biggest decision points.

5 Key Decision Points	1 Flexible Meal (Not Weekend)	2 Drink Limit on Fat-Loss Weeks	7am Move Early — Workout or Walk
---------------------------------	---	---	--

The 5 Weekend Decision Points

FRIDAY DINNER	Decide whether Friday counts as a compliant day before you leave work. Pre-deciding beats in-the-moment willpower every time.
SATURDAY MORNING	Move first. A workout or long walk before 9am sets the standard for the day. Men who train Saturday morning make better choices all day.
SATURDAY DINNER	This is your flexible meal — not a cheat day. One relaxed meal without guilt. Then right back to structure the next meal.
DRINKS DECISION	Decide your drink limit before you arrive. Two drinks on fat-loss weeks. The decision is made before social pressure hits.
SUNDAY STRUCTURE	Eat normally on Sunday. This is the most important reset. Sunday structure means you carry momentum into the week instead of restarting.

"One bad meal does not ruin fat loss. One sloppy pattern repeated every weekend does."

Recovery, Sleep & Stress

Sleep and stress directly affect hunger, training quality, recovery, and the hormonal environment that determines whether your body burns fat or stores it. Recovery is not passive — it is where recomposition physically happens.

Why Sleep Is Non-Negotiable

Testosterone is primarily released during deep sleep cycles. One week of 5-hour nights measurably reduces testosterone levels, increases cortisol, impairs insulin sensitivity, spikes hunger hormones (ghrelin), and crushes gym performance. High-performing men often try to outwork biology. It always backfires.

The Recovery Stack

SLEEP TARGET	7–9 hours Minimum 7 hours for hormonal recovery
CAFFEINE CUT	Before 1–2pm Caffeine's half-life is 5–6 hours — late coffee kills sleep quality
HYDRATION	3–4 liters daily Even mild dehydration impairs strength and raises cortisol
WIND-DOWN	30-minute routine No screens, dim light, same bedtime — signals your nervous system
LOW-STIM WINDOW	1× per week One period completely off your phone — protects mental recovery

>> Stress Is Stored in the Body

Chronic stress elevates cortisol, which promotes fat storage (especially in the abdomen), degrades muscle, disrupts sleep, and increases cravings for high-calorie food. Managing stress is not soft — it is a core strategy for body recomposition.

How to Track Progress

Progress should be measured with enough data to stay honest — but not so much that fitness becomes another job. Track five things and ignore everything else.

01 BODY WEIGHT

3–4 mornings per week

Weigh fasted, after the bathroom, same conditions each time. Use a 7-day rolling average — ignore daily noise.

02 WAIST MEASUREMENT

Once per week

Measure at the navel or widest point. This is the best single indicator of fat loss progress.

03 PROGRESS PHOTOS

Every 2 weeks

Same lighting, same time of day, same poses. Photos catch changes the scale misses.

04 LIFT PERFORMANCE

Each training session

Track your key lifts. If you're getting stronger, you're building muscle — even in a deficit.

05 DAILY STEPS

Every day

8,000+ is the target. Use your phone or a simple fitness tracker. Steps directly correlate to fat loss rate.

Plateau Diagnostic

Before changing the plan, ask these questions in order:

- + Was protein consistent this week? (Most plateaus are protein plateaus)
- + Were weekends controlled? (Most real plateaus are weekend leaks)
- + Was training completed? (Missed sessions don't just lose progress — they signal the wrong adaptation)
- + Were steps hit? (Low activity + low intake = metabolic adaptation)
- + Was sleep bad for multiple consecutive nights? (Fix sleep before fixing calories)

The 12-Week Mog Effect Plan

The plan is phased deliberately. Consistency first. Optimization second. That is always the right order for busy adults with real lives.

WEEKS 1–4

INSTALL THE SYSTEM

- + Learn the meal structure — 3 meals + protein anchor
- + Hit all 3 workouts (even if shortened)
- + Build step consistency — aim for 8,000 daily
- + Remove liquid calories completely
- + Prove the system fits your actual life

MEASURE: Did you complete all 3 workouts? Are steps consistent? Is protein hitting 180g+/day?

WEEKS 5–8

BUILD MOMENTUM

- + Push training intensity — add weight where possible
- + Tighten weekends — enforce the 5 decision points
- + Add cardio sessions only if recovery is solid
- + Judge progress by photos + waist, not just scale
- + Identify your biggest adherence leak and fix it

MEASURE: Is waist down 0.5–1 inch? Are lifts progressing? Are weekends staying controlled?

WEEKS 9–12

FINISH STRONG

- + Stay patient — the last 4 weeks compound everything before them

- + Adjust calories only if progress has truly stalled 2+ weeks
- + Keep travel discipline tight — this phase is when men get sloppy
- + Hold your weekend standard through the finish
- + Document your results — photos, measurements, lift PRs

MEASURE: 12-week total — waist inches lost, strength gained, lifestyle changed?

The 9 Mistakes That Kill Results

These nine patterns account for the vast majority of failed body recomposition attempts in busy men. If you're not making progress, the answer is almost certainly in this list.

01 Eating reactively instead of structurally

Reactive eating means protein is always the first thing cut. You end up eating carbs and fats by default, protecting neither muscle nor fat loss.

02 Chasing sweat instead of progression

Feeling destroyed after a workout is not progress. Progressive overload on your key lifts is the only measurement that guarantees muscle retention in a deficit.

03 Training randomly without a program

Random training produces random results. You need a structured split executed consistently — not a rotation of YouTube workouts and 'whatever feels right.'

04 All-or-nothing thinking on social events

One dinner out is not a reason to abandon the week. Men who use social events as excuses never maintain progress because real life never stops happening.

05 Restarting every Monday instead of adjusting

The restart loop is the death of body recomposition. Adjust mid-week. Never start over — just get back on track the next meal.

06 Believing more information is the missing piece

You don't need more plans, more research, or more podcasts. You need consistent execution of what's already in front of you. This blueprint is enough.

07 Ignoring sleep as a training variable

Men who sleep 5–6 hours lose significantly more muscle and retain more fat during a deficit than men sleeping 8 hours, even at identical calorie intakes.

08 Not tracking protein

Most men who think they're eating 'enough protein' are actually eating 80–100g/day. At body weights of 180–220lbs, that's nearly half the required amount.

09 Expecting linear progress

Weight loss is not linear. It moves in waves over weeks. Men who expect linear progress panic at every plateau and abandon what's working. Trust the system.

Your Next Step

This blueprint gives you everything a busy man needs to get started: a framework, a training split, a nutrition system, travel protocols, and a 12-week execution plan. The question now is what you do with it.

Most men read something like this, feel motivated for 48 hours, and then go back to the same patterns. The blueprint doesn't change that — action does.

The men who actually transform their body inside of 12 weeks have one thing in common: they stopped trying to figure it out alone and got personalized accountability, coaching, and a plan built specifically around their life.

> The Mog Effect Coaching Program

Bryan works 1-on-1 with a small group of high-performing men — sales professionals, executives, and dads who are serious about transforming their body without giving up their life. If you want custom programming, weekly accountability, travel adjustments in real time, and a coach who has done this himself — this is the next step.

What Coaching Clients Get

- + Fully customized training program built around your actual schedule
- + Personalized nutrition targets — not a generic template
- + Weekly check-ins with Bryan directly (no assistants, no team)
- + Real-time adjustments for travel, dinners, and schedule changes
- + Accountability that makes excuses obsolete
- + Access to Bryan's private client community of men just like you

Apply for 1-on-1 coaching with Bryan and get a response within 24 hours. Spots are limited — Bryan keeps his client roster intentionally small.
